

MooringSense project advances in the development of the SmartSensor

MooringSense has taken a step forward in developing the SmartSensor, an intelligent sensor for monitoring the movement of floating platforms, one of the enabling technologies on which the project consortium is working.

Specifically, MooringSense already has a prototype of this low-cost intelligent sensor, the development of which has been led by CTC in collaboration with the Ikerlan technology centre and Zunibal.

The sensor is currently undergoing verification. The prototype has been put on the HarshLab floating laboratory in the port of Bilbao, awaiting installation in its final location in the open sea. The objective of the tests is to validate and verify the accuracy of the sensor measurements in a relevant environment
